

UNIDCOM RIMS — Researcher Portal

What was built, how it works, what it changes

Rui Ramos · idea manager

Andrey Dyakov · backend and business logic

18 September 2026

UNIDCOM / IADE

Portal <https://berlogabob.github.io/Unidcom-IADE/> · Public site <https://berlogabob.github.io/unidcom-site/>

What was built

UNIDCOM’s record used to live in Notion exports and a publications spreadsheet. It is now one database that the public website is generated from — and the only way anything reaches it is a reviewed, attributable edit.

WHEN	WHAT SHIPPED
W1-W4 August	Researchers sign in with the ORCID iD they already have, confirm their profile and claim their work. Staff approve it in one queue. The institutional publication report generates itself from live data.
P0-P14 early Sep	Carmela’s design system applied throughout, five navigation surfaces reduced to one — and a security pass that closed a hole where 153 researcher emails were readable without signing in.
Phase C 8 Sep	Rui’s 14 August notes applied to the live portal. Nothing was deleted — everything retired is one flag away from coming back.
Phase D 10–11 Sep	Rui’s v1.0 specification — 48 requirements — written, built and live in two days, without renaming a single thing in the database.

How it works

Researcher

signs in with their ORCID iD

registry gate: the iD must already be on file

Researcher portal

Flutter web, reads live under RLS

proposals, never direct writes

Supabase

the source of truth — 34 tables, 59 RLS policies

`sync.py`, nightly 04:00 UTC, field allowlist

Public website

Hugo static site, regenerated from the database

Approval is the gate, not a job.

Anonymous visitors see approved rows and nothing else. Publishing is a database policy that cannot silently fall behind, and Approve and Publish are now two separate admin actions.

Three privacy dimensions, deliberately different.

RLS decides which **rows**. Grants decide which **tables**. The sync allowlist decides which **fields** ever leave the database — RLS has no column dimension, which is exactly how the emails leaked.

Researchers hold no write grant.

Own work is recorded through a `security definer` RPC that forces `pending`; profile edits are staged as suggestions for an administrator to accept.

What it delivers today

RESEARCHERS

185

one profile each, theirs to keep current

PUBLICATIONS PUBLIC

365

every one approved before it appeared

TRACKED CHANGES

609

each one attributable to a person

SPEC TO LIVE

2 days

48 requirements, written and shipped

And what a researcher actually meets, before and after September:

MEASURE	BEFORE	AFTER
Menu items to learn	25, 8 of them dead ends	5, all of them real
Pages for a profile / for outputs	6 and 5	one each
Ways to find your own work	2 filters	8 filters, 5 views, 3 groupings
Correcting your own record	not possible, or unreviewed	proposed in place, reviewed, audited
Taking something off the site	only by unapproving it	one click, approval untouched

What it changes

For the researcher

One sign-in with the ORCID iD they already have. One profile page and one outputs page instead of eleven. Corrections are proposed in place and go to a queue — no email, no form, no waiting to find out whether it landed. Their own work is added through a guided DOI-first wizard that refuses obvious duplicates.

For the administrator

A single review queue for profiles, outputs and proposed edits, each decision recorded against a person. Approve and Publish are separate, so a correction can be taken off the website without unapproving the record. Duplicate people can be merged. The institutional publication report is a 24-page PDF generated from live data, not assembled by hand.

For the institution

One source of truth that the public site is generated from, so the website cannot drift from the record. Nothing unapproved is reachable by an anonymous visitor. Every change is attributable. New entity types — projects, funding, PhD students — inherit the same approval gate by adopting one column and one policy; there is no second machine to build.

What it needs to go wide

LIVE

The portal and the public website are deployed and in use, with Rui's v1.0 scope on them in full. Nothing below is engineering work in progress.

YOUR CALL

Name the pilot cohort. Everything downstream of that list is built and verified — it is the one thing not in our hands.

YOUR CALL

26 of 185 profiles carry an ORCID iD. The other 159 researchers cannot sign in until someone adds theirs. An afternoon of administration, not code.

NEXT

Live click-throughs of the proposal flows (≈ 30 min) and three wording decisions from Rui.

TO FIX

Backups cover 9 of 27 tables and a restore has never been rehearsed — the first thing to close once the pilot is running.

TO FIX

One person holds every critical account. A second holder costs nothing and removes the largest single risk.
